

Patient Consent for GenAI Use

Example: Clinician's Script for Patient Consent

“

Before we begin your consultation today, I'd like to discuss with you a tool we are using to help **[core function]** document your medical notes.

We use **[product name]**, which helps me **[discuss function]** to accurately capture what we discuss during your appointment.

This tool allows me to **[purpose/benefits]** focus more on you and your care instead of the computer. It **[explain how it works]** listens to our conversation and creates a summary for me to check and edit before adding it to your patient record.

Your privacy is very important to us. With **[product name]** your information is **[explain how their patient data is stored and kept secure]** de-identified and stored securely for 14 days before it is deleted.

[For those practices with opennotes] If you notice anything in your notes that you'd like updated or corrected, please let us know, and we can make those changes.

Do you have any questions about how this tool works?

Do you give your consent to use **[product name]** during our appointment today and in the future? You can choose to opt in or out at any point.

”

All patient consent, including declined consent, must be recorded in writing against the patient's medical record.
